

WHAT YOU'LL LEARN

The whole thing, in four parts

A business only has three parts: what it sells, how it sells, how it delivers.

An AI agency is no different.

01

BASICS

- What AI, agents and automations actually are
- The 5 pieces every AI agent is built from
- What it costs to run

02

SERVICES — what you sell

- The 3 services an AI agency sells
- Picking one niche and going deep
- The platforms you actually need to learn

WHAT YOU'LL LEARN

Then the part that makes the money

Most people learn to build and stop there. That is why they stay stuck.

03

SALES — how you sell it

- Cold outreach: where to find clients and what to say
- Viral content that brings clients to you
- The frame: sell the meeting, then consult

04

OPERATIONS — how you deliver it

- Installing the system inside their business
- Getting the credentials you need from the client

BEFORE WE START

An AI agency is just a business

Every business needs the same one thing — a constant stream of clients coming in. That is what consistent monthly income actually is.

Freedom is not the money. It is the part that runs while you are not there.

AI FOR PROFIT

BEFORE WE START

Two skills. That's it.

Know exactly what to say when you reach out. And have something to show for yourself online.

It does not matter which platform. X, LinkedIn, YouTube, Instagram — content gives you credibility and puts you in front of the people who need what you sell.

BEFORE WE START

What I'm going to give you

OUTREACH

- Exactly what to say
- The frame to have in your head before you reach out
- How to walk into the meeting

CONTENT

The one thing behind

30,000

followers in 6 months

3 million

views in 9 days

And you don't need millions. 500 good views can still bring you a client.

Two halves of the same job — get in front of them, and be worth finding when they look.

SECTION 01

Basics of AI

These are the concepts I wish I had known when I started.
Even if you are not technical, this gives you enough to start better than 90% of people out there.

- 1 AI Automation vs AI Agent
- 2 AI and LLMs
- 3 API vs Webhook
- 4 Prompting and the 5 elements
- 5 Tokens and pricing
- 6 The 5 parts of an AI agent

AI Automation vs AI Agent

AI AUTOMATION

Like a recipe. We give the computer the exact steps to follow every single time. The AI only helps with one small job inside those steps, like reading an email.

A new lead fills your form → saved to a sheet → welcome email sent → you get a WhatsApp ping. Same four steps. Always.

AI AGENT

Like an assistant with a goal. You tell it what you want and it works out the steps on its own. It can think, pick a tool, check if it worked, and change the plan.

"Book me a haircut for Saturday." It checks your calendar, looks up nearby barbers, calls one, and if that one is full it tries another.

Same steps, or its own steps

AUTOMATION — the same path, every run

AGENT — a different path each time, same goal

Almost every real AI system is automation on the outside, agent on the inside.

AI and LLMs

AI is the big field of making machines act smart, like humans. An LLM is one type of AI that focuses on understanding and writing human language — though now they make images, music and video too.

ChatGPT • **Claude** • **Gemini** • **Mistral**

ARTIFICIAL INTELLIGENCE

the big field of making machines act smart

LARGE LANGUAGE MODELS

AI focused on human language

AI is the whole category. An LLM is one tool inside it.

API vs Webhook

Both are ways for two apps to talk to each other. The only difference is who starts the conversation.

API

Your app asks first. Your agent knocks on the door and asks for something. The other app answers.

POST your agent sends data out — n8n pushes a new contact into the CRM

GET your agent asks for data back — "Calendar, what appointments do I have today?"

WEBHOOK

The other app sends automatically. Nobody asks. Someone fills in a form on the website and your workflow fires instantly with their details.

No polling, no asking. It just fires.

Who starts the conversation

WEBHOOK — the other app sends automatically

Prompting and the 5 elements

LLMs only guess word combinations, so the way you talk to them matters a lot. Writing that input clearly is called prompting.

ROLE

who the AI is acting as *"You are a real estate assistant"*

GOAL

what you want it to do *"Reply to this lead and book a call"*

TONE

how it should sound *"Friendly and short"*

AUDIENCE

who it is talking to *"A busy homeowner"*

SCOPE

the limits *"Under 3 sentences, don't mention pricing"*

The rule: every prompt you write should have at least 3 of these. Don't go lower than 3.

Tokens

Tokens are the small pieces — chunks of words or letters — that LLMs break your text into before reading it. The more tokens you use, the more it costs.

TEXT → TOKENS → NUMBERS

1 token

≈ 0.75 words

1,000 tokens

≈ 750 words · rule of thumb

EXAMPLES

Hello = 1 token

Unstoppable = 3–4 tokens

Pricing

This is how tokens are usually priced. Output tokens are 3x to 5x more expensive than input tokens.

EXAMPLE • GPT-4o

INPUT

\$2.50 / 1M tokens

OUTPUT

\$10 / 1M tokens 4x

So tell the LLM in the system prompt to be concise. Shorter replies mean fewer output tokens, which means lower cost.

Your client pays for the APIs. Work out how much text goes in versus comes out before you close the deal — better they know now than later as a hidden cost.

The 5 parts of an AI agent

Every AI agent — no matter what platform you build it on: n8n, Relevance, VAPI, Voiceflow — is just these 5 pieces working together.

LLM

the brain

GPT, Claude or Gemini. Decides what to do.

INSTRUCTIONS

the rules

You telling it what to do, and in what order.

TOOLS

the hands

Gmail, Calendar, Notion — to actually do things.

KNOWLEDGE

the library

The client's own information and documents.

MEMORY

the notepad

Remembers the conversation and the context.

Sometimes we use 3, sometimes 4, sometimes all 5. Rarely fewer than 3.

One brain, four helpers

Learn these 5 once and every platform becomes easy — the buttons change, the concept doesn't.

END OF SECTION 01

You'll see all of this again

These concepts come up again and again once you start. That is the whole point of learning them first.

- **Tokens** help you price the system, because the client is the one paying for the APIs
- **The 5 parts** show up in every platform that builds agents — n8n, VAPI, Voiceflow, all of them
- **Webhooks & APIs** are how every automation you build actually talks to the client's tools

Next: what we actually sell that businesses pay for.
